

Version  
1.0

# Traffic Survey Technology

March  
1994

Traffic Survey Technology for the first time explains the principles behind Pneumatic tube and inductive loop technologies. An introduction to the care and maintenance of batteries commonly found with these technologies is also covered. The viewer will be able to apply these principles to optimise site selection and equipment set up, ensuring data is collected as accurately as possible.

The graphic animation and clear explanations make it essential viewing for all personnel involved in the specification, collection or analysis of traffic survey data.

Distributor enquires should be directed to:
